Variables used by the residual-flasher cuts

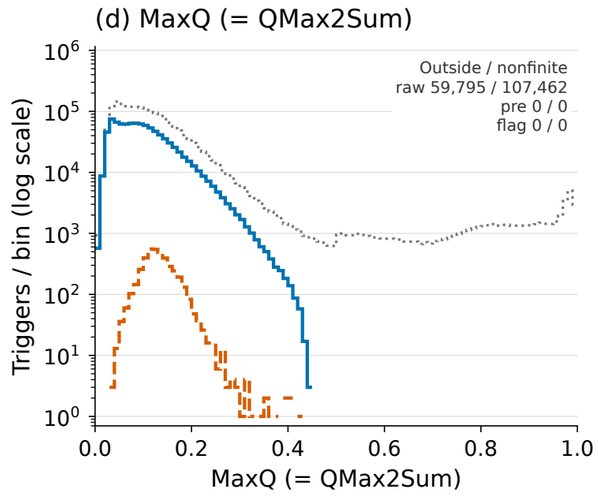

P21A / EH3 | 3 mini-files | Runs 81743, 82379, 82989 | AD detectors 1–4

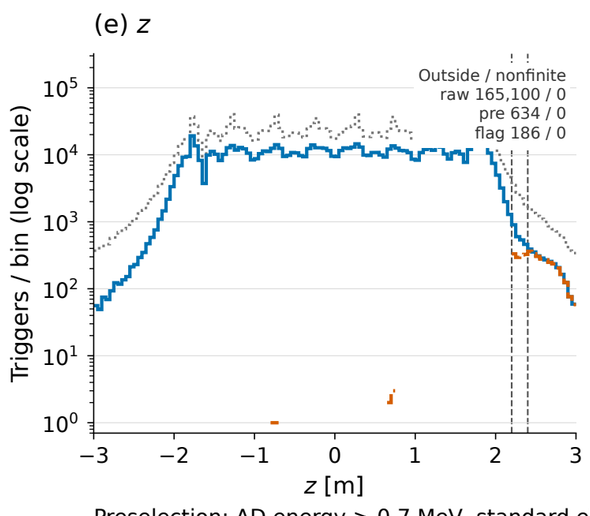

All AD triggers: 2,079,464
Energy + standard flasher preselection: 925,747
Residual-cut flag within preselection: 4,123

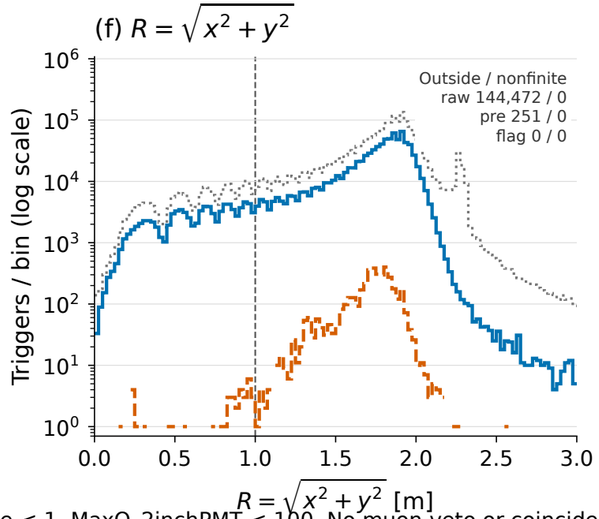

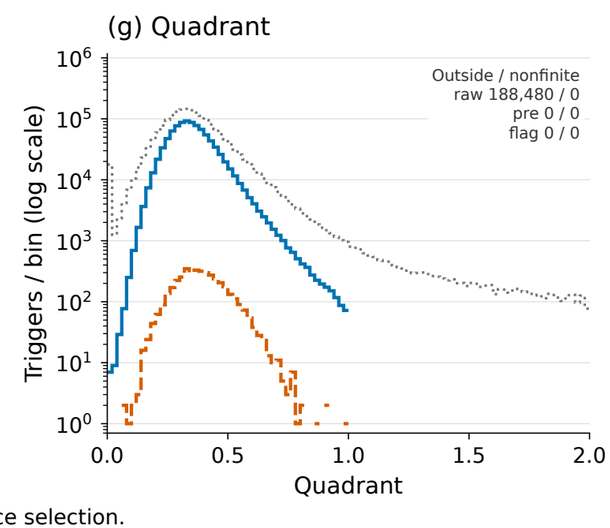

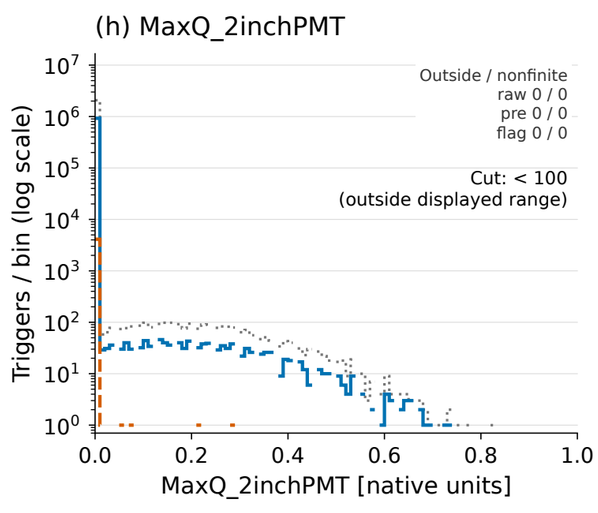

Preselection: AD energy > 0.7 MeV, standard ellipse < 1, MaxQ_2inchPMT < 100. No muon-veto or coincidence selection.

Raw counts, no normalization or smoothing. Zero bins are omitted on log axes. Outside = underflow + overflow; native units are retained where unverified.

Gray guides mark coordinates used in cuts, not independent acceptance boundaries. The residual flag is a cut condition, not a confirmed-flasher label.
